Process Monitor HOW-TO for Linux

AI Dev (Alavor Vasudevan) alavor@yahoo.com

v8.0, 07 Mar 2001

This document describes how to monitor Linux/Unix processes and to re-start them automatically if they die without any manual intervention. This document also has URLs for "Unix Processes" FAQs.

1. [Linux or Unix Processes](#)
 2. [Unix/Linux command – procautostart](#)
 3. [File procautostart.cpp](#)
 4. [File debug.cpp](#)

1. [Linux or Unix Processes](#)

Processes are the "heart" of the Linux/Unix processes. It is very important to monitor the application processes to ensure 100% availability and reliability of the computer system. For example, processes of databases, web-server etc.. need to be up and running 24 hours a day and 365 days a year. Use the tools described in this document to the monitor important application processes.

See also the following related topics on Linux/Unix processes.

- Unix Programming FAQ – Chapter 1 Unix Processes
http://www.erlenstar.demon.co.uk/unix/faq_toc.html
 - Other FAQs on Unix are at <http://www.erlenstar.demon.co.uk/unix/>
-

2. Unix/Linux command – procautostart

Use the program **procautostart** (say "Prok-Auto-Start" or Process AutoStart) to monitor and automatically re-start any Unix/Linux process if they die. This tiny program is very powerful and is comparable to big commercial products which **costs about \$80,000US**. Procautostart can be used for controlling following applications:

- For real-time control of process industries like chemical, manufacturing, power generation and others. Use *nano-seconds* in program to get fine control.
- For controlling processes of software applications like Web servers, database servers, mission critical unix processes, etc..
- As an alarm system for any general monitoring software system. The program can fire a pager or call cell phone or flash red lights on the computer screen. For calling a phone line you may need to use a Telephone card on PCI slot of the computer.

The program listing is given in following sections in this document.

```
procautostart -n < delay_seconds > -c "< command_line >" nohup &
```

This starts the unix process **procautostart** and also **command_line** process. The **procautostart** process will re-start **command_line** process if it dies. The **-n** option is the time delay in seconds before **procautostart** checks the running process started by **command_line**. It is advisable to start the procautostart as background process with no-hangup using "nohup &". See 'man nohup'.

The procautostart is written in "C" so that it is very fast and efficient, since the program is called every *n* seconds. Amount of resources consumed by procautostart is **very minute** and is negligible since the program size is small and is highly optimized with **-o3** compiler option.

For example –

```
procautostart -n 12 -c "monitor_test -d $HOME -a dummy_arg " nohup &
```

Here **procautostart** will be checking the process monitor_test **every** 12 seconds.

The program will output log files in 'mon' sub-directory which has datetime stamp of when the processes died and re-started. These files gives info on how often the processes are dying.

You can also use micro-seconds option '**-m**' or nano-seconds option '**-o**', edit the source code file **procautostart.cpp** and uncomment appropriate lines.

3. [File procautostart.cpp](#)

// From your browser save this file as **text-file** named as 'procautostart.cpp'.

```
//
// Program to monitor the unix processes
// and automatically re-start them if they die
//

#include <stdio.h>

else
    errno = EINTR; /* well, sort of :-) */

return -1;
}
```

4. [File debug.cpp](#)

// From your browser save this file as **text-file** named as 'debug.cpp'.

```
// This file defines the debug_() function which can be used for debugging
// the program. It is similar to "C" assert(). The debug_() is set to void()
// if DEBUG is not defined in Makefile. This way executable size of production
// release is NOT AT ALL effected. Using debug_() very generously has no
// impact on production executable size.
#ifdef DEBUG

#include "debug.h"
// Variable value[] can be char, string, int, unsigned long, float, etc...

void local_dbg(char name[], char value[], char fname[], int lineno, bool logfile) {
    printf("\nDebug %s Line: %d %s is = %s\n", fname, lineno, name, value ); }

void local_dbg(char name[], int value, char fname[], int lineno, bool logfile) {
    printf("\nDebug %s Line: %d %s is = %d\n", fname, lineno, name, value ); }

void local_dbg(char name[], unsigned int value, char fname[], int lineno, bool logfile) {
    printf("\nDebug %s Line: %d %s is = %d\n", fname, lineno, name, value ); }

void local_dbg(char name[], long value, char fname[], int lineno, bool logfile) {
    printf("\nDebug %s Line: %d %s is = %d\n", fname, lineno, name, value ); }

void local_dbg(char name[], unsigned long value, char fname[], int lineno, bool logfile) {
    printf("\nDebug %s Line: %d %s is = %d\n", fname, lineno, name, value ); }

void local_dbg(char name[], short value, char fname[], int lineno, bool logfile) {
    printf("\nDebug %s Line: %d %s is = %d\n", fname, lineno, name, value ); }
```

Process Monitor HOW-TO for Linux

```
void local_dbg(char name[], unsigned short value, char fname[], int lineno, bool logfile) {
    printf("\nDebug %s Line: %d %s is = %d\n", fname, lineno, name, value ); }

void local_dbg(char name[], float value, char fname[], int lineno, bool logfile) {
    printf("\nDebug %s Line: %d %s is = %f\n", fname, lineno, name, value ); }

void local_dbg(char name[], double value, char fname[], int lineno, bool logfile) {
    printf("\nDebug %s Line: %d %s is = %f\n", fname, lineno, name, value ); }

// You add many more here - value can be a class, ENUM, datetime, etc...

#endif // DEBUG
```

5. [File debug.h](#)

// From your browser save this file as **text-file** named as 'debug.h'.

```
#ifndef DEBUG

#include <stdio.h>
// #include <strings.h>
// #include <assert.h> // assert() macro which is also used for debugging

// Debugging code
// Use debug2_ to output result to a log file
#define debug_(NM, VL) (void) ( local_dbg(NM, VL, __FILE__, __LINE__) )
#define debug2_(NM, VL, LOG_FILE) (void) ( local_dbg(NM, VL, __FILE__, __LINE__, LOG_FILE) )
void local_dbg(char name[], char value[], char fname[], int lineno, bool logfile= false);
void local_dbg(char name[], int value, char fname[], int lineno, bool logfile= false);
void local_dbg(char name[], unsigned long value, char fname[], int lineno, bool logfile= false);
void local_dbg(char name[], float value, char fname[], int lineno, bool logfile= false);

#else

#define debug_(NM, VL) ((void) 0)
#define debug2_(NM, VL, LOG_FILE) ((void) 0)

#endif // DEBUG
```

6. [Makefile](#)

From your browser save this file as **text-file** named as 'Makefile'.

```
EXE=procautostart
SRCS=procautostart.cpp debug.cpp
OBJS=procautostart.o debug.o

CXX=gcc

HOSTFLAG=-DLinux
```

Process Monitor HOW-TO for Linux

```
#HOSTFLAG=-DSunOS

# Do not use compiler optimizer -O as this may break the program
# Use debug flag to enable the debug() function. If DEBUG is not
# defined than the function debug() is set to void(), similar
# to assert()
# Use options -Wall (all warning msgs) -O3 (optimization)
#MYCFLAGS=-DDEBUG -g -Wall
MYCFLAGS=-O3 -Wall

all: $(OBJS)
    $(CXX) $(HOSTFLAG) $(MYCFLAGS) $(OBJS) -o $(EXE)

$(OBJS): $(SRCS)
    $(CXX) -c $(HOSTFLAG) $(MYCFLAGS) $(SRCS)

clean:
    rm -f *.o *.log *.log.old *.pid core err a.out afiedt.buf
    rm -f $(EXE)
```

7. Testing the program – monitor_test

From your browser save this file as **text-file** named as 'monitor_test'.

Use this program for testing the 'procautostart' program. For example –

```
procautostart -n 12 -c "monitor_test -d $HOME -a dummy_arg " nohup &
```

Here **procautostart** will be checking the process monitor_test **every** 12 seconds.

```
#!/bin/ksh

# Program to test the procautostart

echo "Started the monitor_test ...."
date > monitor_test.log
while :
do
    date >> monitor_test.log
    sleep 2
done
```

Then do a tail command to monitor the output. And simulate the failures of monitor_test programs.

```
bash$ tail -f monitor_test.log
bash$ ps -ef | grep monitor_test
See the PID of monitor_test and kill it..
bash$ kill -9 < PID of monitor_test >
```

Once you kill the process, you will notice that it immediately comes alive due to procautostart !

8. Other Monitoring Tools

8.1 OpenSource Monitoring Tools

On linux systems you can find the following packages. If it is not in the main cdrom than you must check in the contrib cdrom :

- On contrib cdrom **daemontools*.rpm**
- 'top' command **procps*.rpm**
- 'top' command graphic mode **procps-X11*.rpm**
- 'ktop' graphic mode **ktop*.rpm**
- 'gtop' graphic mode **gtop*.rpm**
- 'WMMon' CPU load **wmmon*.rpm**
- 'wmsysmon' monitor **wmsysmon*.rpm**
- 'procmeter' System activity meter **procmeter*.rpm**

To use top commands type at unix prompt –

```
$ top
$ ktop
$ gtop
```

8.2 Monitoring Tool – "daemontools"

Visit the web site of daemontools at <http://www.pobox.com/~djb/daemontools.html>

To install the daemontools RPM, do –

```
# rpm -i /mnt/cdrom/daemontools*.html
# man supervise
```

supervise monitors a service. It starts the service and restarts the service if it dies. The companion svc program stops, pauses, or restarts the service on sysadmin request. The svstat program prints a one-line

status report. See man page by 'man supervise'

svc – control a supervised service.

svc changes the status of a supervise-monitored service. dir is the same directory used for supervise. You can list several dirs. svc will change the status of each service in turn.

svstat – print the status of a supervised service.

svstat prints the status of a supervise-monitored service. dir is the same directory used for supervise. You can list several dirs. svstat will print the status of each service in turn.

cyclog writes a log to disk. It automatically synchronizes the log every 100KB (by default) to guarantee data integrity after a crash. It automatically rotates the log to keep it below 1MB (by default). If the disk fills up, cyclog pauses and then tries again, without losing any data. See man page by 'man cyclog'

accustamp puts a precise timestamp on each line of input. The timestamp is a numeric TAI timestamp with microsecond precision. The companion tailocal program converts TAI timestamps to local time. See 'man accustamp'

usually watches a log for lines that do not match specified patterns, copying those lines to stderr. The companion errorsto program redirects stderr to a file. See 'man usually'

setuser runs a program under a user's uid and gid. Unlike su, setuser does not gain privileges; it does not check passwords, and it cannot be run except by root. See 'man setuser'

8.3 Commercial Monitoring Tools

There are commercial monitoring tools available. Check out –

- BMC Patrol for Unix/Databases <http://www.bmc.com>
 - TIBCO corp's Hawk for Unix monitoring <http://www.tibco.com>
 - LandMark corporation
 - Platinum corporation
-

9. [Other Formats of this Document](#)

This document is published in 11 different formats namely – DVI, Postscript, Latex, Adobe Acrobat PDF, LyX, GNU-info, HTML, RTF(Rich Text Format), Plain-text, Unix man pages and SGML.

- You can get this HOWTO document as a single file tar ball in HTML, DVI, Postscript or SGML formats from – <ftp://sunsite.unc.edu/pub/Linux/docs/HOWTO/other-formats/>
- Plain text format is in: <ftp://sunsite.unc.edu/pub/Linux/docs/HOWTO>
- Translations to other languages like French, German, Spanish, Chinese, Japanese are in <ftp://sunsite.unc.edu/pub/Linux/docs/HOWTO> Any help from you to translate to other languages is welcome.

Process Monitor HOW-TO for Linux

The document is written using a tool called "SGML-Tools" which can be got from – <http://www.sgmltools.org> Compiling the source you will get the following commands like

- `sgml2html CVS-HOWTO.sgml` (to generate html file)
- `sgml2rtf CVS-HOWTO.sgml` (to generate RTF file)
- `sgml2latex CVS-HOWTO.sgml` (to generate latex file)

LaTeX documents may be converted into PDF files simply by producing a Postscript output using **sgml2latex** (and `dvips`) and running the output through the Acrobat **distill** (<http://www.adobe.com>) command as follows:

```
bash$ man sgml2latex
bash$ sgml2latex filename.sgml
bash$ man dvips
bash$ dvips -o filename.ps filename.dvi
bash$ distill filename.ps
bash$ man ghostscript
bash$ man ps2pdf
bash$ ps2pdf input.ps output.pdf
bash$ acroread output.pdf &
```

Or you can use Ghostscript command **ps2pdf**. `ps2pdf` is a work-alike for nearly all the functionality of Adobe's Acrobat Distiller product: it converts PostScript files to Portable Document Format (PDF) files. **ps2pdf** is implemented as a very small command script (batch file) that invokes Ghostscript, selecting a special "output device" called **pdfwrite**. In order to use `ps2pdf`, the `pdfwrite` device must be included in the makefile when Ghostscript was compiled; see the documentation on building Ghostscript for details.

This howto document is located at –

- <http://sunsite.unc.edu/LDP/HOWTO/CVS-HOWTO.html>

Also you can find this document at the following mirrors sites –

- <http://www.caldera.com/LDP/HOWTO/CVS-HOWTO.html>
- <http://www.WGS.com/LDP/HOWTO/CVS-HOWTO.html>
- <http://www.cc.gatech.edu/linux/LDP/HOWTO/CVS-HOWTO.html>
- <http://www.redhat.com/linux-info/ldp/HOWTO/CVS-HOWTO.html>
- Other mirror sites near you (network-address-wise) can be found at <http://sunsite.unc.edu/LDP/hmirrors.html> select a site and go to directory `/LDP/HOWTO/CVS-HOWTO.html`

In order to view the document in dvi format, use the `xdvi` program. The `xdvi` program is located in `tetex-xdvi*.rpm` package in Redhat Linux which can be located through ControlPanel | Applications | Publishing | TeX menu buttons. To read dvi document give the command –

```
xdvi -geometry 80x90 howto.dvi
man xdvi
```

And resize the window with mouse. To navigate use Arrow keys, Page Up, Page Down keys, also you can use 'f', 'd', 'u', 'c', 'l', 'r', 'p', 'n' letter keys to move up, down, center, next page, previous page etc. To turn off expert menu press 'x'.

You can read postscript file using the program 'gv' (ghostview) or 'ghostscript'. The ghostscript program is in ghostscript*.rpm package and gv program is in gv*.rpm package in Redhat Linux which can be located through ControlPanel | Applications | Graphics menu buttons. The gv program is much more user friendly than ghostscript. Also ghostscript and gv are available on other platforms like OS/2, Windows 95 and NT, you view this document even on those platforms.

- Get ghostscript for Windows 95, OS/2, and for all OSES from <http://www.cs.wisc.edu/~ghost>

To read postscript document give the command –

```
gv howto.ps
ghostscript howto.ps
```

You can read HTML format document using Netscape Navigator, Microsoft Internet explorer, Redhat Baron Web browser or any of the 10 other web browsers.

You can read the latex, LyX output using LyX a X-Windows front end to latex.
